A simian species of IL-15 (sIL-15) was purified and analysed by SDS-
RAGE. Bioassay of unstained gel slices indicated IL-15 activity was
assoc. with proteins having mol. wis in the range of 15-17 kDa. The
assoc. with proteins having mol. wis in the range of 15-17 kDa. The
Identity of the first 33 AAs of AAR83309. Subsequent sequencing of a
convariant of the 15-17 kDa was sequenced. The results indicated the
identity of the first 33 AAs of AAR83309. Subsequent sequencing of a
convariant of ARR8330 was used to design synthetic PCR primers
of the polypeptide AAR83309 was used to design synthetic PCR primers
of the amplification of IL-15-specific DNA sequences. The first
of AAs of the N-terminus were used to design on primer,
of egenerate mixture coding for all possible codon usages - AAT00528.
The AA sequences of the similan mature coding for a
complement of all possible codon usages of AAs 26-31, omitting
complement of all possible codon usages of AAS 26-31, omitting
complement of all possible codon usages of AAS 26-31, omitting
consider a second primer, a degenerate mixture coding for a
complement of all possible codon usages of AAS 26-31, omitting
consideration probe to screen a portion of a plasmid library contg.
CDNA inserts prepd, from CV-1/EBNA polyadenylated RNA. This
resulted in the isolation of clone C85:sIL-15 that has an ORF
the precursor polypeptide.
                                                                                                                                                                                                                              - which
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        300
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               61 ctaaagagtcattttctaactgaagctggcattcatgtcttcattttgggctgtttcagt 120

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                             cDNA generated from PMA-stimulated CV-1/EBNA cells was amplified by PCR using primers based on the N-terminal sequence of simian interleukin-15 (sIL-15). A probe based on an isolated clone was ut oscreen a plasmid library containing cDNA inserts prepared from CV-1/EBNA poly-A RNA. Clone C85.sIL-15 was isolated that has the
New purified interleukin-15 - which induces T cell proliferation and differentiation, used for the treatment of tumours and viral
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ;

This is the nucleotide sequence encoding a simian epithelium-derived T-cell factor (ETF). The protein was purified from African green monkey CV-1 kidney cells in culture by conventional chromatography: hydrophobic, anion exchange and reverse phase HPLC, followed by separation by SDS-PAGE. The proteins from the SDS-PAGE were transferred to a PVDF membrane and the band corresp. to ETF was cut out for peptide sequencing Primers were synthesised based on this sequence and used to amplify a proliferate by phorbol 12-myristate 13-cetate. The 92 bp fragment was labelled and used as a probe to isolate a clone C85.sTF which contained this sequence. ETF is a protein of 15-17 kD which is expressed by epithelial cells and stimulates proliferation and/or differentiation of precursor and/or mature T cells. The protein is therefore useful for promoting long term in vivo culture of T-lymphocytes and T-cell lines.

                                                                                                                                                                    Human ETF (epithelium derived T cell factor) cDNA was isolated by screening a IMTLH cell cDNA library with a simian ETF probe. The IMTLH cell line was derived from a stable transformation of a human bone marrow stromal cell culture with pSV3Neo. Mature hETF induces proliferation and/or differentiation of precursor or mature T cells and is useful for promoting long-term in vitro culture of T-lymphocytes and T-cell lines. It is used for treating gastrointestinal diseases including peptic ulcer, colitis and malignancy and for treating HIV infection.
                                                                                                                                                                                                                                                                                                                                                                                                                       1 AIGAGÀATTICGAAACCACATITGAGAAGTATTICCATCCAGIGCTACCTGTTTACTT

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Antagonists of interleukin-15 - are used to treat patients having symptoms of graft-versus-host disease and for prolonging allo:graft
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   A cDNA clone (AAT36634) codes for simian interleukin-15 (IL-15) (AAR98526), a T-cell growth factor. Muteins of simian IL-15 or human IL-15 (see also AAR98527) are useful as antagonists of IL-15 and can be prepd. by PCR-mediated mutagenesis of the encoding sequences. Preferred muteins have amino acid substitutions at Asp56 and/or Gln156 of the IL-15 protein that prevent signal transduction. They are useful for treating graft-versus-host

                                                                                                                                                                                                                                                                                                        This sequence encodes a human epithelium-derived T-cell factor (ETF) which is used in a method for treating or preventing gastrointestinal disease. These polypeptides have particular application in the treatment of gastrointestinal disorders associated with disruption of the gastrointestinal epithelium or villi such as chemotherapy- and radiation-therapy induced entertits (gut toxicity), mucositis, peptic ulcer disease, gastroenteritis and collis, villus atrophic disorders, malignancy and inflammatory bowel disease. ETF polypeptides may also be useful in the treatment of human immunodeficiency virus (HTV) and HIV-associated disease due to their ability to stimulate CD4+ and CD8+ cells. Biologically active ETF may be used to treat a variety of other diseases or conditions where T-cell or B cell stimulation is desired.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             180
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   300
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             480

The invention relates to an isolated antibody that binds specifically to a similar or human epithelium-derived T-cell factor (ETF) polypeptide. The antibodies are used, optionally when immobilized or labeled, to detect and quantify ETF in standard immunossaps. They may also be used as diagnostic and therapeutic agents, e.g. when conjugated to toxins (or their precursors) or radionuclides. ETF induces proliferation and/or differentiation of T cells (or their precursors), e.g. for use in cestablishing long term in vitro cultures; and is also used to treat gastrointestinal disease (e.g. enteritis or mucositis induced by chamotherapy or radiation, peptide ulcer, gastroenteritis, colitis, colitis, willus atrophy, malignancy and inflammatory bowel disease, or generally in any situation requiring stimulation of T or B cell companies in the color of the color of proliferation, secretion of immunoglobulins or certain cytckines, concreased anti-infection of immunoglobulins or certain cytckines, concreased anti-infections of tumour or virus-infected cells. The present sequence represents a DNA encoding a human ETF precursor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö

The IL-15 nucleotide sequence and the protein encoded by it can be used to determine and create antagonists of IL-15. An antagonist of IL-15 can be used for treating an inflammatory bowel disease (IBD). The invention relates to the treatment of celiac disease using IL-15 antagonists. The antagonists are preferably muteins of IL-15, antibodies against IL-15 or IL-15 molecules bound to chemical groups that interfere with the ability of IL-15 to effect a signal transduction through either the alpha or the gamma subunit of the IL-15 receptor complex. The IL-15
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   treating an inflammatory bowel

                                                                                                                                                                                                                                                                                                    This sequence represents human epithelium-derived T-cell factor (ETF) cDNA. ETF is a previously unidentified T-cell growth factor which stimulates precursor or mature CD4 and CD8+ T-lymphocytes to proliferate and differentiate. It also promotes to promote long-term in vitro culture of T-lymphocytes and T-cell lines. ETF can be used for treating HIV infection, HIV-associated diseases, and other diseases or conditions where stimulation of T-cell proliferation would be desirable e.g., it could be used to augment the destruction of tumour cells or virally-infection deals. ETF may also be used to treat or prevent gastrointestinal
                                                                                                                                                                                                                                                                                                                                                                                                                 disease, including chemotherapy and radiotherapy associated enteritis, gastroenteritis, colitis, inflammatory bowel disease and villus atrophic disorders. Chemotherapy and radiotherapy associated enteritis (gut toxicity) results in bleeding and sepsis due to gastrointestinal flora entering the blood, and thus can limit the dosage of therapeutic agent administered to a cancer patient. ETF may therefore be used to increase

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to simlan and human epithelium-derived T-cell factor (ETF) polypeptides. Antibodies that specifically bind to the ETF polypeptides are used for treating or preventing gastrointestinal diseases, such as chemotherapy and radiation therapy-induced enteritis and mucositis, peptic ulcer disease, villus atrophic disorders and

inflammatory bowel disease; for increasing tolerated doses for radiation therapy and chemotherapy agents which are limited by gastrointestinal toxicity; and for treating HIV and HIV-associated diseases. The antibodies are further used to treat a variety of other diseases or conditions where it is desired to stimulate proliferation of IV-lymphocytes, to augment anti-infectious disease immunity, to induce CTL, LAK or NK lytic activity, or to augment the destruction of tumour cells or cells infected with virus. The present sequence represents a cDNA encoding the human ETF (HETF) polypeptide.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to similar and human epithelium-derived T-cell factor (ETF) polypeptides. Antibodies that specifically bind to the ETF polypeptides are used for treating or preventing gastrointestinal diseases, such as chemotherapy and radiation therapy induced enteritis and mucositis, peptic ulcer disease, villus atrophic disorders and inflammatory bowel disease; for increasing tolerated diseases, for radiation therapy and chemotherapy agents which are limited by gastrointestinal toxicity; and for treating HIV and HIV-associated diseases. The conditions where it is desired to stimulate proliferation of T-lymphocytes and B lymphocytes, or the secretion of immunoglobulin B lymphocytes, to augment anti-infectious disease immunity, to induce CTL, LMK or NK lytic activity, or to augment the destruction of tumour cells or cells infected with virus. The present sequence represents a cDNA encoding the human ETF (hETF) mature polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New antibodies that specifically binds epithelium-derived T-cell factor polypeptide useful for e.g. treating or preventing gastrointestinal diseases, HIV and HIV-associated diseases, augmenting destruction of tumour cells

sequence and cDNA sequence analysed (see AAR83309, AAR83436, AAR00524, AAT00525). Both the simian and the human ORFs encode a precursor polypeptide (AAR83436, AAR83438). The precursor polypeptide (AAR83436, AAR83438). The precursor polypeptides a 48-AA leader sequence and a sequence encoding mature simian or human IL-15 polypeptides. The active simian and human IL-15 polypeptides are disclosed in AAR83309 6, AAR8310 respectively. The invention also comprises other mammalian IL-15, including human IL-15, that hybridise to probes defined by CDNA was deposited with ATCC on Feb. 19 1993 under ATCC 69245. The deposit was named 141-hETF. AAR83435 is a mammalian mature IL-15 polypeptide. It is a generic sequence which encompasses both AAR83309 (simian) and AAR83310 (human) IL-15 mature polypeptides.

     New epithelium derived T cell factor - induces proliferation of T and B cells, stimulates destruction of tumour and virus-infected cells and protects against toxicity, partic. for treating intestinal disease and HIV infection
                                                                                           African green monkey CVI_EBNA cell conditioned medium. The N-
terminal sequence of the purified sETF was determined and then PCR
primers were designed based on the sequence information. A 92 bp
fragment was amplified from CVI_EBNA DNA and was used as a probe to
secreen a CVI_EBNA CDNA library for the full-length sETF coding
sequence (i.e. the present sequence). Mature sETF induces
proliferation and/or differentiation of precursor or mature T cells
and is useful for promoting long-term in vitro culture of
T-lymphocytes and T-cell lines. It is used for treating
gastrointestinal diseases including peptic ulcer, colitis and
                                                                                     simian ETF (epithelium derived T cell factor) was isolated from
                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                Length 489;

This is the nucleotide sequence encoding a human epithelium-derived the corresp. African gene was obtained using a 1.37 kb fragment of the corresp. African green monkey gene (AAT42242) as a probe to screen a cDNA library constructed from RNA derived from the IMTLH cell line. This cell line is derived by stable transformation of a human bone marrow stromal cell culture with psylace. From a pool of about 1000 cDNA clones, one clone 141.hETF contained this sequence. ETF is a protein of 15-17 kD which is expressed by epithelial cells and stimulates proliferation and/or differentiation of precursor and/or mature T cells. The protein is therefore useful for promoting long term in vivo culture of T-lymphocytes and T-cell lines.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   67 AGTCATTTTCTAACTGAAGCTGGCATTCATGTCTTCATTTTGGGCTGTTTCAGTGCAGGG 126

                                                                                                                        A cDNA clone (AAT36635) codes for human interleukin-15 (IL-15) (AAR98527), a T-cell growth factor. Muteins of human IL-15 or similan IL-15 (see also AAR98526) are useful as antagonists of IL-15 and can be prepd. by PCR-mediated mutagenesis of the encoding sequences. Preferred muteins have amino acid substitutions at Asp56 and/or Gln156 of the IL-15 protein that prevent signal transduction. They are useful for treating graft-versus-host
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Interleukin-15; IL-15; mutant; human; treatment; autoimmune disease; psoriasis; multiple sclerosis; rheumatic arthritis; immune response; type 1 diabetes; AIDS; ss.
Antagonists of interleukin-15 - are used to treat patients having symptoms of graft-versus-host disease and for prolonging allo:graft survival
                                                                                                                                                                                                                                                                                                                                                                                                             ö

This DNA encodes a wild-type interleukin-15 (IL-15) polypeptide. This wild-type sequence can be mutated at codon positions 149 and 156 to create a mutant IL-15 polypeptide. The mutant polypeptide is at least of dentical to wild-type IL-15 and is capable of inhibiting at least one of the cellular events that normally occurs when wild-type IL-15 specifically binds to a cell surface receptor. The mutant IL-15 is used for suppressing the immune response in a patient. It can be used for treating autoimmune diseases such as rheumatic trian be used for treating autoimmune diseases such as rheumatic lupus erythematosus (SLE), or a rheumatic disease selected from systemic lupus erythematosus (SLE), Sjogren's syndrome, scleroderma, mixed connective tissue disease, dermatomyositis, polymyositis, Reiter's syndrome and Behcet's disease, cermatomyositis, polymyositis, seiter's syndrome and Behcet's disease, cermatomyositis, myasthenia gravis, encephalomyelitis, avariety of pemphigus, psoriasis, inflammatory bowel disease, AIDS and vascular injury. The mutant IL-15 can also be used for reducing the viability of a cell that expresses a IL-15 antagonist.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This DNA encodes a mutant interleukin-15 (IL-15) polypeptide. The wild-type IL-15 sequence was mutated at codon positions 149 and 156 to create this mutant IL-15 polypeptide is at least of create this mutant IL-15 polypeptide is at least cone of the cellular events that normally occurs when wild-type IL-15 one of the cellular events that normally occurs when wild-type IL-15 one of the cellular events that normally occurs when wild-type IL-15 specifically binds to a cell surface receptor. The mutant IL-15 is used to suppressing the immune ersponse in a patient. It can be used for treating autoimmune diseases such as rheumatic arthritis, type I diabetes or a rheumatic disease selected from systemic lupus erythematosus (SLE), Slogten's syndrome, soleroderma, mixed connective tissue disease.

C a rematomyositis, polymyositis, Reler's syndrome and Behcet's disease.

It can also be used to treat Hashimoto's thyroiditis, Grave's disease, multiple sclerosis, myasthenia gravis, encephalomyelitis, a variety of pemphigus, psoriasis, inflammatory bowel disease, AIDS and vascular collular. The mutant IL-15 can also be used for reducing the viability of a cell that expresses a IL-15 receptor. It can also be used to diagnose

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This sequence encodes human interleukin-15 (IL-15) (see AAW01658), a known T-cell growth factor that can support proliferation of an IL-2-dependent cell line, CTLL-2. Compans. contg. IL-15 to stimulate muscle growth, differentiation or hypertrophy are claimed. The stimulation of muscle growth is useful for treating atrophy, or wasting, in particular, skeletal and cardiac muscle atrophy. The compans. further comprises a steroid, growth hormone and insulin-like growth factor. Congestive heart failure, muscle wasting and diabetes-associated.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                CTCCCTAAAACAGAAGCCAACTGGGTGAATGTAATAAGTGATTTGAAAAAATTGAAGAT 186

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This sequence encodes human interleukin-15 (IL-15), which can be used in immunogenic amount of a vaccine antigen (Ag) and an immunogenic amount of a vaccine antigen (Ag) and an immunogenicity augmenting amount of IL-15. The composition is useful for enhancing the immunogenicity of a vaccine. The cytokine IL-15 is a potent T and B cell growth factor. It causes proliferation and differentiation of these cells and augments T cell mediated immune responses. The vaccine composition can sufficiently elicit an immune response without being deleterious to the recipient, especially when using pathogenically deficient antigens. Some vaccines do not elicit a strong immune response
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       CTCCCTAAAACAGAAGCCAACTGGGTGAATGTAATAAGTGATTTGAAAAAATTGAAGAT 186

These polypeptides have particular application in the treatment of gastrointestinal disorders associated with disruption of the gastrointestinal epithelium or villi such as chemotherapy and radiation-therapy induced enteritis (gut toxicity), mucositis, peptic ulcer disease, gastroenteritis and colitis, villus atrophic disorders, malignancy and inflammatory bowel disease. Err polypeptides may also be useful in the treatment of human immunodeficiency virus (HIV) and HIV associated disease due to their ability to simulate CD4+ and CD8+ cells. Biologically active ETF may be used to treat a variety of other diseases or conditions where T-cell or B cell stimulation is desired.
                                                                                                                                           Epithelium derived T-cell factor; ETF; simian; gastrointestinal disease; B-cell stimulation; epithelium; villi; CD4+; CD8+; T-cell stimulation;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             AGTCATTTTCTAACTGAAGCTGGCATTCATGTCTTCATTTTGGGCTGTTTCAGTGCAGGG 126

```
The invention relates to an isolated antibody that binds specifically to a simian or human epithelium-derived T-cell factor (ETF) polypeptide. The antibodies are used, optionally when immobilized or labeled, to detect and quantify ETF in standard immunoassays. They may also be used as diagnostic and therapeutic agents, e.g. when conjugated to toxins (or their precursors) or radionuclides. ETF induces proliferation and/or differentiation of T cells (or their precursors), e.g. for use in establishing long term in vitro cultures; and is also used to treat gastrointestinal disease (e.g. enteritis or mucositis induced by chemotherapy or radiation, peptide ulcer, gastroenteritis, colitis, villus atrophy, malignancy and inflammatory bowel disease, to treat human immune deficiency virus infection or associated disease, or generally in any situation requiring stimulation of T or B cell colleration. Secretion of immunoalization, secretion of immunoalization, secretion of immunoalization contines, induction of T cell lytic activity or increased destruction of tumour or virus-infected cells. The present sequence represents a DNA encoding a simian ETF precursor
                                                                                                                                                                                                                                                                                                                           Epithelium-derived T-cell factor; ETF; immunoassay; enteritis; ulcer; T cell proliferation; gastrointestinal disease; mucositis; colitis; gastroenteritis; villus atrophy; malignancy; inflammatory bowel disease; human immune deficiency virus; tumour; simian; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        sequence. The IL-IS nucleotide sequence and the protein encoded by it can be used to determine and create antagonists of IL-IS. An antagonist of IL-IS can be used for treating an inflammatory bowel disease (IBD). The invention relates to the treatment of cellac disease using IL-IS antagonists. The antagonists are preferably muteins of IL-IS, antibodies against IL-IS or IL-IS molecules bound to chemical groups that interfere with the ability of IL-IS to effect a signal transduction through either the alpha or the gamma subunit of the IL-IS receptor complex. The IL-IS antagonists of the invention can be used to treat irritable bow disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Use of antagonists of interleukin-15 for treating an inflammatory bowel disease, particularly celiac disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    AGTCATTTTCTAACTGAAGCTGGCATTCATGTCTTCATTTTGGGCTGTTTCAGTGCAGGG 126
